Abstract

This compilation work presents an up-to-date list of the cyanophycean algae reported by various workers in past from Nepal. It comprises a total 274 taxa belonging to 61 genera under 12 families.

Key words: Cyanobacteria, blue-green algae, enumeration, checklist, Nepal

Introduction

Nepal (26°22'-30°27'N, 80°04'-88°12'E), a small Himalayan country (area ca 147181 km²), is very rich in water resources as it has about 2323 glacier lakes and 2252 snow fed rivers in the Himalaya; about 6000 rivers, streams and thousand of waterfalls in the mountain; and many lakes, ponds, puddles and wetlands in the terai regions of the country; altogether about 7437 km² (5% of the total land) area as the favourite habitats for algae. Besides these, the diverse topography (elevation range 56 m to 8848 m) and climate also make the country rich in algal diversity. However, except sporadic collections, the extensive exploration of algae in the country has never been done as it has been given least preference in comparison to land vegetation specially the phanerogams.

This is an attempt to list out the total blue-green algae reported from Nepal by various phycologists at different time intervals till the date mainly on the basis of available literature. It includes a total 274 taxa as the latest data on the cyanophycean algae of Nepal. Here, the families are

arranged following Desikachary (1959) and taxa are arranged alphabetically in each family.
